

## Surface Spray application for long term dust control on traffic areas.

### DustLess® Does Not Function Like Water or Chlorides

It is specially formulated to absorb into the individual soil particles rather than surround and “float” the particle as does water. The individual particles remain in direct contact with each other keeping the soil surface firm, good coefficient of friction (traction), no stickiness, thus no tracking. The product is not alkaline, is not acidic, it is non-corrosive and non-hazardous. Effective dust control lasts for about one year. Watering is never required. Climate or humidity are not factors. It does not wash away or dilute in rain events. Reapplications after the initial application are done at a much lower rate to renew highly effective, long lasting control.

### The Solution for Extreme Dust

- High traffic or heavy traffic areas
- Does not form a crust and never evaporates thereby being unaffected by traffic
- 9 – 15 months dust control with one application
- Application is very simple - anything that will apply water can apply DustLess
- No equipment clean up necessary

A dirt road that is regularly watered has a higher cost due to the expense of the truck, the driver, the maintenance and the fuel vs. an annual or even semiannual treatment of DustLess.
